

De interne functies

SKIP	(a2 a1 ch -- a2 a3)	Sla char. ch over
SCAN	(a2 a1 ch -- a2 a3)	Zoek char. ch
LIB-FIND	(a +n -- sa)	Zoek string a +n
LIB-REFILL	(src-id -- f)	Lees code regel in
LIB-LOAD	(sa --)	Laad code sectie

Het werkpaard

```
1008,1000 constant LIB      \ Library start address
LIB value LIBHERE          \ Current end address of library

: LIB-FIND ( a +n -- sa ) \ a,+n=name, sa=begin-source-section
  >fhere count upper      \ Place as counted string a,b at FP
  libhere lib            \ Library address range
  begin
    09 scan 1+          \ Find library section, skip 09
    2dup = ?abort 2dup  \ Nothing found?
    0D scan nip over 1+ \ Get line with keywords, skip \
    begin
      2dup > while      \ Line not done?
        bl skip dup >r  \ Skip leading spaces
        bl scan        \ After keyword
        r@ over r> -   \ Keyword length
        FP count s<> 0= \ Keyword found, leave source address
        if 2drop nip exit
      then
    repeat
      2drop
  again ;
```

Bibliotheek source code

wipe-lib

open-lib

lib-section ROLL

v: forth definitions

```
: ROLL ( i*x u -- j*x ) \ Roll item u to TOS
  dup 1 <
  if      drop
  else    swap >r 1- RECURSE r> swap
  then ;
```

%%

lib-section VERSION VERSIE VSN

```
cr .(   NEED version 0.31   )
cr .(   Library version 0.20   )
cr .(   Size is about 168 kBytes   )
```

%%

lib-section PIN SQUERY

```
( GPIO -- ) \ Change GPIO pin for S?
```

need [IF]

```
dup dm 29 > [if] drop dm 24 [then]
```

```
0 swap b+b 1 cfg ! \ Use UART-0 & GPIO-xx for S?
```

```
4 cfg @ abs 4 cfg ! \ Make sure to (re)start
```

```
config cr .( Test S? ) s? .
```

close-lib

Voorbeelden

<code>.LIB (--)</code>	List all library headers in 2 columns
<code>NEED ("name" --)</code>	Add "name" to noForth t ...
<code>NEEDED (a +n --)</code>	Add word name a +n to noForth t

Met `.LIB` krijgen we een overzicht van de opgenomen programma stukjes. We laden eerst de functie `VIEW` erbij, om de bibliotheek source te kunnen bestuderen.

```
.LIB
```

```
NEED view
```

```
VIEW view
```

Willen we de assembler gebruiken:

```
NEED asm\
```

Om b.v. commacode woorden te genereren:

```
NEED commacode
```

NEED variant met een string op de stack:

```
S" .CFG" NEEDED
```

```
NEED allwords
```

```
ch d chwords
```

```
4 lenwords
```

```
Etc.
```

Toetje voor AvdH

```
: WANT ( "ccc" "etc." -- ) \ Add all the words
begin
bl parse ?dup while \ Next string not zero?
needed \ Yes, add it
repeat drop ; \ No, clear stack
```
